Small-size АФА - МИГАИК

duration of cycle - 0.7 sec; positioning range on the drift angle - $\pm 360^\circ$; angle of inclination of the optical axis - $\pm 10^\circ$; power input without heating - up to 5 amp; idem with heating - up to 10 amp; flight weight - 5 kg; overall dimensions - 340 x 320 x 150 mm. The AFA-MIIGAiK camera is fitted with a miniature super wide-angle lens and central inter-lens shutter of the band type as described by the author and N. P. Zakasnov [Ref. 3: Tsentral'nyye aerofotozatvory lentochnogo tipa (Central Aerial Camera Shutters of the Band Type). Trudy MIIGAiK. No. 39. 1960]. The camera can be easily placed in the serial hatch of the ЯК-12 and АН-2 (YaK-12 and AN-2) aircrafts. Parts of the magazine and drive mechanism of the АФА-39 (AFA-39) camera are used in the AFA-MIIGAiK design. Laboratory and flight tests of the camera proved that it has a resolving power which permits an enlargement of aerial photographs by a factor of 3 without noticeable blurring. The photogrammetric distortion within the range of a 51.5 x 51.5 mm frame does not exceed 0.03 m, which means the photos for mapping purposes can be taken. To investigate the alignment quality of the film the "reflection" method was used [Ref. 1: Arzhanov, Ye. P. Metod kombinirovannogo kontrolyya vyравнивания aeroplenki (Method of Combined Alignment Checking of Aerial Films). Dissertation. MIIGAiK. Moscow. Ed. 1958]. The film deviated from the plane by 0.03 mm only. The sagging of the film which amounted

Small-size АФА - МИИГАиК

to 0.4 - 0.5 mm without vacuum can be eliminated at a vacuum of 10 - 20 mm water column. A fully dependable alignment is attained at 150 mm. Flight tests of the АФА-МІІГАіК camera were carried out on the AN-2 aircraft, the flight altitude ranging from hedge hopping to 4,000 m. At a speed of 180 km/hour aerial photos with a longitudinal overlapping of 60% from an altitude of 40 m were obtained. At an exposure of 1/200 sec. the geometric shift of the picture does not exceed 0.16 mm. It is suggested to reduce the overall dimensions of aerial cameras to 250 x 250 x 150 mm, cut their weight to 2 - 3 kg and develop interchangeable magazines with a film reserve of up to 30 m. There are 1 figure and 3 Soviet-bloc references.

AUTHORS: Dolgoshein, B. A.; Luchkov, B. I.; Rodionov, B. U.

TITLE: Streamer chamber

SOURCE: Zh. eksper. i teor. fiz., v. 46, no. 6, 1964, 1953-1959

TOPIC TAGS: particle counter, particle detector, spark discharge chamber, charged particle trajectory, cosmic ray measurement

ABSTRACT: The authors describe in detail the construction and mechanism of operation of a new type of gas discharge track chamber, the development of which was stimulated by the unsatisfactory operation of the commonly used multilayer spark or discharge chamber. The new streamer chamber possesses all the advantages of a spark chamber (rapid action, simplicity of construction and of auxiliary high-voltage techniques, possibility of constructing chambers of large dimensions, etc.) and at the same time records with good resolution the

Card 1/4

ACCESSION NR: AP4042551

spatial picture of any event occurring in the chamber volume, and presents a picture of the charged particles in the chamber irrespective of their direction of motion. A detailed description of the chamber design and the auxiliary equipment is given elsewhere (PTE, in press). The mechanism of formation of the particle tracks is discussed and results of experimental investigations of various characteristics of the chamber are presented. The effect of different gas media and gas pressures was also studied. The results show that the brightness and structure of the track depend on the direction of particle trajectory relative to the electric field in the chamber. Furthermore, particle tracks in the chamber are not very bright and are rather wide in the electric-field direction, which impairs the spatial resolution. The advantages of the streamer chamber over the spark chamber are evident in such important parameters as dead time and the possibility of measuring the ionizing ability of the particles. The streamer chamber can also be very useful for the study of processes related to the physics of gas discharge such as streamer velocity, electron shower

Card 2/4

ACCESSION NR: AP4042551

path length, fluctuations in showers, and other discharge characteristics, since the primary electrons that initiate the discharge are accurately localized in the region between electrodes. "The authors thank Professor A. I. Alikhanyan for his interest in the work, Yu. Grashin, S. Somov, V. Chuvilo, and V. Dmitrenko of MIFI, and L. V. Sukhov of FIAN for great help in the work, and also V. Ry*kalin of LYaP OIYaI for supplying the photographic film. Orig. art. has: 6 figures.

PURPOSE: This book is intended for geologists, mineralogists, and petrographers.

COVERAGE: This is a collection of 25 articles on the formation, geology,
mineralogy, petrography, and geochemistry of deposits of rare elements in
Siberia and [Soviet] Central Asia. The distribution and characteristics of
rare elements found in these areas as well as some quantitative and qualitative
methods of investigating the rocks and minerals in which they are found.

AUTHOR: Rodionov, F. Lieutenant, Commander of Tank Platoon

TITLE: One Should Never Fire Mechanically.

PERIODICAL: Tankist, 1958, Nr 6, p 15 (USSR)

ABSTRACT: Often, the gun layers try to do their job in a too-mechanical way -. This is caused by insufficient comprehension of the firing regulations. The author has organized a training ground for training crews in firing missions. It is a miniature range on which all elements in a mission are assembled together. These elements are: distance, target, landmarks, aiming, and variable firing data.. By imitating real fire, and by discussing the imaginary results, the crews become familiar with the regulations.

AUTHORS: Krasil'nikov, L. A., Rodionov, F. L.

TITLE: A Machine for Fatigue Tests of Wires at High Temperatures

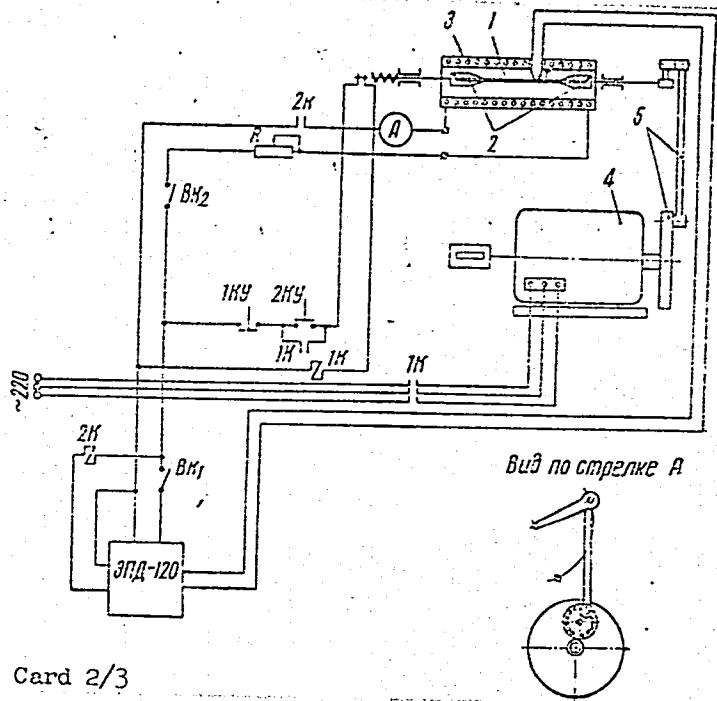

PERIODICAL: Byulleten' tekhniko-ekonomiceskoy informatsii, 1960, No. 8, pp.31-33

TEXT: The authors point out that information on the life of wires at high temperatures is still rather insufficient, although components like valve springs operate at temperatures in the range of 300-600°C. Therefore the authors developed a machine for the testing of wire fatigue at temperatures of up to 600°C, the machine being built and operated at the Beloretskiy staleprovolochno-kanatnyy zavod (Beloretsk Steel-Wire and Cable Plant). The illustration shows the schematic block diagram of the machine.

Figure:

1 - specimen being tested; 2 - clamping fixtures; 3 - heating furnace; 4 - motor; 5 - lever-eccentric mechanism; ЗПД-120 (EPD-120) - electronic potentiometer.

A Machine for Fatigue Tests
of Wires at High Temperatures

The wire specimen is fastened in the clamping fixtures and is subjected to alternating rotation by a motor through a lever-eccentric mechanism which is located in a hermetically sealed metallic housing with oil. By setting the lever of the mechanism in different holes of the crank disk it is possible to control the magnitude of twist of the specimen being investigated. The angles of rotation of the specimen at any given lever position are

S/193/60/000/008/009/018
A004/A001

A Machine for Fatigue Tests of Wires at High Temperatures

preliminarily marked with the aid of a protractor. The load stresses are given by the angles of twist. The machine is equipped with a cylindrical furnace which makes it possible to test specimens at temperatures of up to 600°C. The location of the heating spiral within the furnace ensures a sufficiently uniform distribution of temperature over its whole length. The temperature is checked and controlled by the EPD-120 potentiometer. The testing frequency is 1,500 cycles/minute. The number of cycles is recorded by a counter. There is 1 figure.

AUTHORS: Krasil'nikov, L.A., Rodionov, F.L.

TITLE: Equipment for measuring stress relaxation in wire

PERIODICAL: Izmeritel'naya tekhnika, no.7, 1962, 17-18

TEXT: It is important to know the relaxation stability of spring materials under different loading conditions and, particularly in the case of coil springs, the stress relaxation on twisting within various temperature ranges. Accordingly, the Central Laboratory of the Beloretskiy staleprovolochno-kanatnyy zavod (Beloretsk Steel-Wire and Rope Works) has studied this characteristic of spring wires in the temperature range 100 to 600°C, with initial shear stresses up to 100 to 150 kg/mm² using an equipment designed by the author with the cooperation of V.A.Chertousov. The ends of the wire are held by clamps which can rotate. One is loaded and the other is twisted to set up an initial torque in the wire. Deflection is measured by pointer readings and torques are graphically converted to stress for different diameters of wires. When stress relaxation during the test relieves the loaded clamp, contacts apply geared motor drive to the other clamp to maintain

Card 1/2

S/115/62/000/007/004/008
E194/E455

Equipment for measuring ...

the loading. The test wire is surrounded by an electrically heated tube. In steel specimens, relaxation increases greatly with temperature. High initial stress is associated with high relaxation. Numerous tests have shown that the rate of relaxation is greatest at the start. For a wire of metastable structure (highly hardened and not tempered), at 500°C, the maximum rate of relaxation at a stress of 100 kg/mm² was 1.78 kg/mm² per sec for the first twenty seconds. The r.m.s. error on a wire of 1.5 mm diameter at temperatures of 200 to 300°C and stress of 40 to 50 kg/mm² was about 1.5%. There are 3 figures.

RODIONOV, G. G.

The So-Called Apographic Pegmatites

The author presents the results of an investigation of unusual structures (often observed in micaceous pegmatites), described by D.S. Korzhinskiy under the name of apographic structures (Slyudy SSSR (Micas of the USSR), 1937), by N. V. Petrovskaya ("Gigantico-Migmatitic Type of Pegmatites of the Mamsk-Vitimsk Mica Bearing Region," ONTI-NKTP SSSR, Moscow, 1937) under the name of "transitional structures", and by V. D. Nikitin (Zap. Vses. Mineralog. o-va, No. 4, 1950; Zap. Leningr. Gorn. in-ta, 1952), under the name of segregational structures. The author describes the processes governing the substitution of microcline by quartz with the formation of typical apographic structures. (RZhGeol, No. 5, 1955) Tr. in-ta po Proyektirovaniyu i Nauch.-Issled. Rabotam v Slyudanoy Prom-Sti, No. 1, 1954, 73-85.

ACCESSION NR: AT4019028

of neutrons. The different role (and, hence, danger) of the neutron in the reactor and in the shielding is noted. Of the possible applications of conjugate functions to the theory of perturbations, the authors single out two for special consideration. In the first place, a knowledge of the conjugate function makes it possible to select the most rational positioning of the materials in the shielding. In the second place, it makes it possible to derive the variations of the values of interest to the specialist (dosages, thermal emissions, etc.), connected with certain changes in the structure and planes of interaction, and also with effects not previously considered, without the repetition of unwieldy computations, but merely through the application of the perturbation theory ratio. From this point of view, the authors consider and derive the formulas of this theory and certain functions in the theory of shielding. The use of the method of consecutive approximations for the determination of the optimal disposition of shielding materials is considered, as well as the efficiency function of the shielding materials themselves. The article concludes with a study of certain effects in shielding made of iron (and of iron with 1% by weight of boron), 20 cm thick, in the light of the theory of perturbations. "The authors express their gratitude to A. I. Leypunskiy, V. Ya. Pupko and E. Ye. Petrov for their valuable counsel and commentary." Orig. art. has: 52 formulas, 9 figures and 4 tables.

TITLE: The solar nature of asymmetry of equinoctial maxima of geomagnetic disturbance

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 12, 1962, 58, abstract 12N418 ("Tsirkulyar. Astron. observ. L'vovsk. un-ta", 1960, no. 35 - 36, 78 - 86)

TEXT: In order to confirm the known explanation of equinoctial disturbance maxima by the proximity of the Earth's projection on the solar disk to geoactive regions during these periods, the authors investigated the correlation of the geomagnetic disturbance number in autumn with the area of sunspots in the northern hemisphere of the Sun and of the number of disturbances in springtime with the sunspot area in the southern hemisphere. Rather low positive correlation coefficients (0.39 - 0.40) were thereby obtained. Then were investigated the numbers of strong magnetic storms with sunspot areas in favorable hemispheres (from the viewpoint of Korti's effect). In this case, correlation coefficients

Card 1/2

The solar nature of asymmetry of...

S/035/62/000/012/011/064
A001/A101

turned out essentially positive (0.63 - 0.55). On this basis, the authors hold as proven that equinoctial disturbance maxima can be explained by the Korti effect; however, only low correlation coefficients between the sunspot area in unfavorable hemispheres and the number of magnetic disturbances, with respect to coefficients calculated by the authors, would represent the decisive proof of this statement. There are 6 references. X

AUTHOR: Rodionov, G.N.

TITLE: Active longitudes on the sun

SOURCE: Lvov. Universitet. Astronomicheskiy sbornik, no. 3-4, 1960, 31-34

TEXT: The average daily distribution of the total area of sun spots in the circle whose center coincides with the center of the solar disc and whose radius is 30° , as taken from Soviet solar-activity catalogs for 1948-1954, published in Trudy GAO, and from the bulletins of Gornaya stantsiya Pulkovskoy observatorii (Mountain Station of the Pulkovo Observatory) for 1955-1957, points to the following: no regularity is observed for conditional rotation periods of 26^d and $27^d.3$; four active longitudinal regions spaced at 90° to one another are observed for conditional rotation periods of 27^d ; three active longitudinal regions spaced at 120° are observed for conditional rotation periods of 28^d . Same analysis carried out for a 27^d rotation period according to Tsirkulyary Tashkentskoy Astronomicheskoy observatorii, no. 1 to no. 214 (1932 to 1948), detects two active longitudinal regions spaced at 180° . Analysis of the differential ✓

Card 1/2

Active longitudes on the sun

index (difference in the total daily sun spot areas in the central circle for two consecutive days) for 1948-1957 confirms the existence of four active longitudinal regions spaced at 90° , and shows that the maximum of the positive daily differences comes about 3-4 days ahead of the maximum of negative differences. There are 6 figures.

TEXT: The correlation between \bar{W}_{\max} and $\bar{\varphi}_{\min}$ ($\bar{\varphi}$ being the average heliographic latitude of the first high-latitude groups of spots that appear 1/2 to 1 1/2 years before the formal commencement of the 11-year cycle) published in 1954 (Ref.3:M.S.Eygenson and T.L.Mandrykina, Astr. sb., No.2, Lvov, 1955) gave excellent agreement between the predicted Wolf number ($W_{\max} \sim 200$ from the first one-day group at $\varphi = +52$ observed on August 13, 1953) and the actual figure measured in 1958 at the Gornaya stantsiya GAO AN SSSR ($W_{1958} = 198$). Rodionov (Ref.5: G.M.Rodionov. Tsirk. LAO, No. 29, 1955), having established a definite phase shift between the maxima of the 11-year prominence cycle in the $40-50^\circ$ and $50-60^\circ$ zones and the 11-year sun spot cycle, predicted in 1957

Card 1/2

New procedure for the prognosis...

(Ref.4: G.N.Rodionov. Tsirk. Astrosovet, No. 178, 1958) that the maximum of the No. 19 cycle would be attained in the second quarter of 1958; in fact, t_{max} for the No. 19 cycle was 1958.5. The satisfactory results point to the scientific soundness of these procedures.

TITLE: Solar nature of the asymmetry of the equinoctial maxima of geomagnetic disturbances

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 5, 1962, 30, abstract 5G222 (Tsirkulyar. Astron. observ. L'vovsk. un-ta, no. 35-36, 1960, 78-86)

TEXT: Solar corpuscular radiation emanates from active regions as approximately radial flows; the centers of the sun's active regions shift during the 11-year cycle; on account of the yearly change in the sun's declination the conditions of the earth's heliocorpuscular irradiation vary during the year. This creates the maximum magnetic field disturbances in periods of equinoxes and in years when the solar activity is at a maximum. The author examines different types of solar and geomagnetic asymmetries, which might be expected in the absence of the masking effects and enumerates certain effects and the observed deviations from the theoretical
